thyroid function stimulatury course.

(alim 4, page 12, 18pp; Japanese.

T79919-179922 represent the immunoglobulin heavy and light chain variable regions isolated from peripheral blood lymphocyte strains. These sequences were isolated from the BBT and 101-2 strains of peripheral blood lymphocytes of a Basedow's disease patient. These sequences are replaced, deleted or inserted into an antibody, to create the antibodies of the invention have thyroid function stimulating activity, and act by combining with thyrotropin receptor. The antibody can be used in a method to detect autoantibodies which have thyroid function stimulating activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 21; Fig 43; 94pp; English

Example 21; Fig 43; 94pp; English

The present sequence is the variable kappa chain gene segmen;

containing human DNA fragment; VK65 9, which was co-injectred along
with the human DNA fragments VK6 3, VK65 5 and VK65 15 into half
day mouse embryo pronuclei, to generate an unrearranged light chain
minilocus transgene. The resulting transgent mice can be used for
                                                                                                                                                                                                                                                                          14-APR-1997 (first entry)
May fragment wk6.8, containing variable kappa chain gene.
Variable: kappa chain, gene segment; human; DNA fragment; vk65.8:
unrearranged; light chain; minilocus; transgene; transgenic; monse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indole / Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     7 ACGCAGITCICAGGCACCCIGITIIIGICICCAGGGGAAAGAGCCACCCICICCCGGGG 66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Indels 0, Sape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from the resulting clones were sequenced and functional clones were selected on the basis of open reading frames, intact donor and acceptor splice sites and intact recombination sequences. The sequences obtained from four different plasmid clones were designated p65.3, p65.5, p65.8 and p65.15 (see Q44222-Q44225,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The V-kappa specific oligonucleotide 050327 was used to probe a human placental genomic DNA library cloned into lambdaEMBL3/SPB/T7. DNA fragments containing V-kappa segments from positive phage clones were subcloned into plasmid vectors. Variable gene segments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  495 decaggetenteatetatggtgeatecageaggagenactggeateceaganaggttnagt

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 claim 12, Pages 24-25, 46pp; English chain from the monoclonal antibody (MAb) TB2A36C3, which has high specificity against lung tumour antigens and is produced by an Epstein-Barr virus (EBV) transformed TB945 human R cell line. The MAh can be used to screen serum or tissue samples for a carcinoma associated antigen, lyse tumours in anti-tumour therapy (optionally with other agents) and activate immune competent CD4 or CD8 cells in a patient's bload
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            lung cancer) patient were cut into fine pieces and mashed. Fure B cells, isolated using CD19 coated immunomanetic beads, were immortalised by EBV transformation, and plated and assayed for activity. Clones which showed positive reactivity with autologous rumour cells from the patient and the SCLC cell line NC1H69, were subjected to limiting dilution to prepare the MAb. (Pevised entry submitted to correct cross-reference to the

Example: Page 27-29: 35pp: English.

Blood samples were collected from patients immunised with allergens including rapped (Ambrosia elator) extracts. The dominant allergen in short rapped (Ambrosia elator) extracts. The dominant allergen in short rapped (Ambrosia elator) extracts. The dominant allergen in short rapped and a protein A single cell such strand colores.

Then fused with mouse myloma cell line 653 and the resultant clones can be a single and a protein A single cell such strand colore Action and allergen in secreting was selected. Total RNA was propd from the AL 15-3.2 cells and first strand color was proped from the AL 16-5.2 cells and first strand color was the template, and the 5' and 3' kappa light chain primers (165540, 165541) were used in PCR and amplified band of the expected size was contact this amplified by a sequence are shown in 166538 and 185286. Comparison of the deduced to that the AL 165.2 L-chain is a member of the human VK III subpp.
                                                                                                                                                                                                   NECESTRATE AND CONTROLLED FOR THE CONTROLLED FOR THE STATE OF SOCIAL STATES AND CONTROLLED AND C

consists of a DNA molecule having two cassettes to express two soluble proteins a heavy chain and a light chain. The vector comprises. operatively linked 5' to 3', a first cassette consisting of the phonorometer/operator sequences, an EcoRI restriction site, a ribosome binding site (RRS), an OmpA leader, a Stil restriction site, a spacer region, a cloning region bordered by 5' sacl and 3' Xbal restriction sites, an NcoI restriction site between the two cassettes, and a second cassette consisting of an expression control RBS, a PolB leader, a human consensus amino terminus spacer region comprising the sequence EVQLLE, a cloning region bordered by 5' XhoI and 3' SpeI restriction sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the expression vector, ppho-TI which is a modified version of the phagemid expression vector, promis given in Q92346. Pho-TI provides for the expression of soluble Fabs which are secreted into the periplasmic space which is regulated from the alkaline phosphatase (phoA) promoter. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV 99120. PPho-TI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            followed by a Sfil site, expression control stop sequence EVOLLE, followed by a Sfil site, expression control stop sequences and a Notl restriction site. The pPho-TT expression vector contains a light chain stuffer that is 1200 bg in length and a Neary chain stuffer that is 300 bg in length. The nucleotide sequences of the heavy and light chain stuffers encode the heavy and light chain variable domains of a tetanus toxin-specific Fab.

This sequence was pref dayd in the method of the lowering for the production of antibody libraries containing increased diversity. The sequences given in 97040 86 are primers which were used for induction of mutagenesis in a complementary determining tegton (CDR) of an immunoglobulin light chain gene. These primers contain a 3' terminus capable of hybridising to a first framework region, a 5' terminus capable of hybridising to a formation framework region, a 5' terminus capable of hybridising to a second framework region and a nothernorm sequence between the 5' and 3' termini having the formula (NNK). Where is 3.24. These primers may be used to produce antibods in the control of immunoglobulins heavy or light chains that are displayed on the surface of filamentous phane particles comprising the library. These primers prof. mutate the light chain CDR3. Sequence 645 BP. 152 A: 187 C: 177 C: 127 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligo-nucleotides - used as PCB primers for production increased diversity antibody libraries, for screening antibodes and page 84.85; 120pp; English.
This sequence represents the light chain coding sequence derived from this sequence represents the light chain coding sequence derived from the surface display phagement expression vector, pright, prightly contains the bacteriophage gene III and heavy and light chain variable domain sequences for encoding human Pah antibodies against Letanus Loxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           64-APR-1995 (first entry)

The gene may be isolated from the bone marrow soln of a rheumatoid arthritis patient and used to produce hybridomas, allowing produ. of the rheumatoid arthritis factor at constant quality in large quantites.
